## Why keep membranes clean

- Poor permeate quality and flow, increased operation pressures
- Higher energy requirements
- Water wastage – lower recoveries
- Operational Expenditure – membrane cleaning, membrane replacement

## • Membrane Autopsies 2002-2009

### Type of foulants

- Biofilm & organic matter
- Colloidal/particulate matter
- Scales & Inorganic deposits
- Not detected

### Scale & Inorganic Deposits

- Ox. Fe/Mn
- CaSO<sub>4</sub>
- CaCO<sub>3</sub>
- SiO<sub>2</sub>
- Ca-Phosphate
- Ba/Sr SO<sub>4</sub>

## Membrane pressure damage

Org:

## Autopsy results 2001 - 2009

### Type of foulants

- Biofilm & organic matter
- Colloidal/particulate matter
- Scales & Inorganic deposits
- Not detected

### Scale & Inorganic Deposits

- Ox. Fe/Mn
- CaCO3
- Ca-Phosphate
- CaSO4
- SiO2
- Ba/Sr SO4

## Recent Innovations

- **Scaling**                      **Advanced antiscalants for calcium phosphate, calcium sulphate & silica**
- **Cleaners**                      **Remove clay & biofouling**
- **Flocculant**                      **Reduce use of iron & aluminium coagulant**
- **Lab techniques**                      **Autopsy and particle counting**

## Acid v's Antiscalant

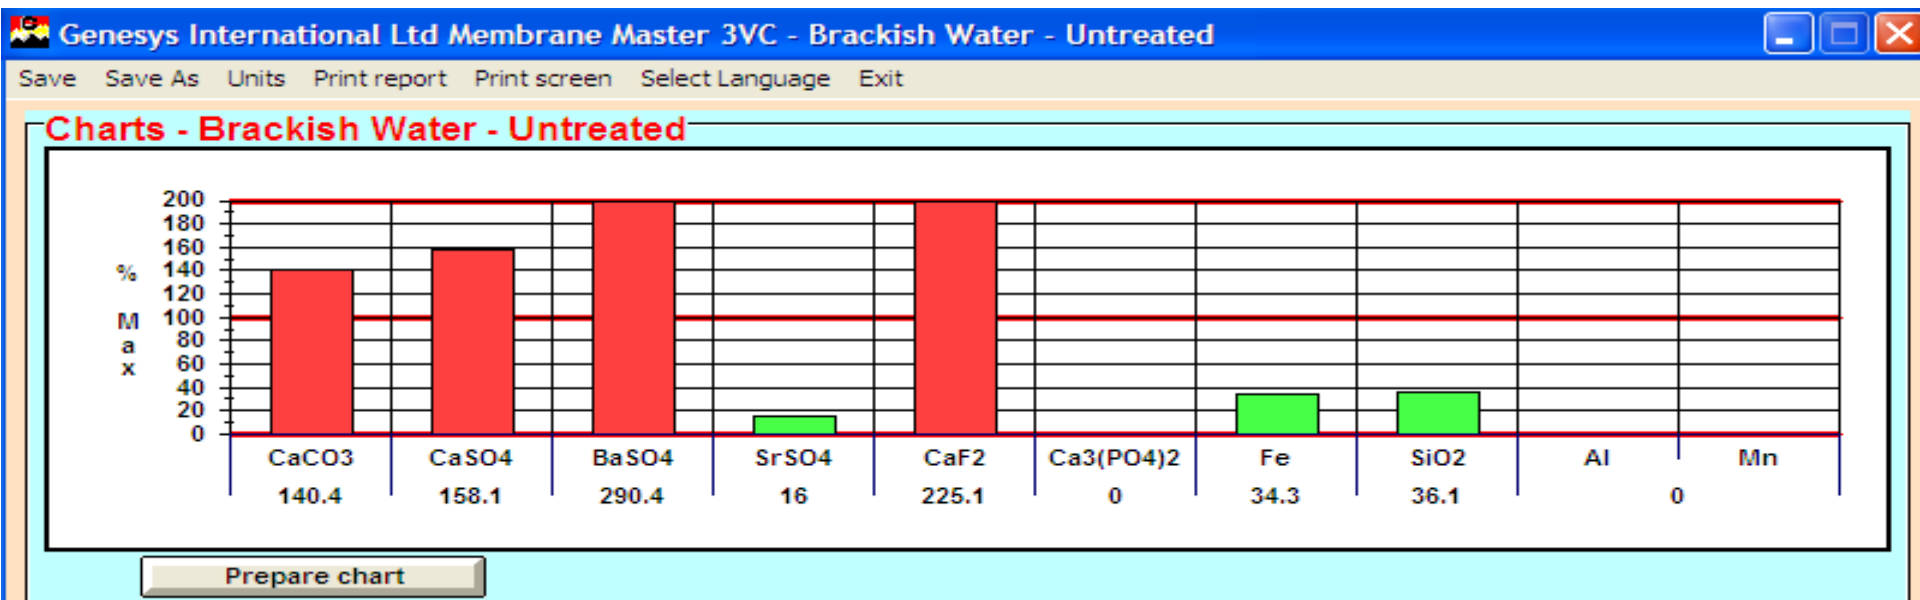

- Acid dosing traditionally used to control scale in membrane plants - LSI
- High dose rate v's antiscalant
- Health & Safety – transport, storage and handling issues
- Poor activity against some scales

## Feed Water Challenges

- Capacity of BWRO has increased by 7 million m<sup>3</sup>/day since 2002
- Scarcity of water requires use of “difficult” feed waters
- High in silica, sulphates, phosphates
- Drive to reduce operation costs
- Demand to increase recovery rates

## WWRO Plant

- Current Total Capacity 2,342,079 m<sup>3</sup>/day (IDA)
- Total 713 plants & increasing!
- Largest in Middle East (Sulaibiya 375,000 m<sup>3</sup>/day)
- New projects in Australia, Singapore & Europe
- WWRO approx 50% of cost of SWRO.
- Calcium phosphate Issues

**WWRO Plants**

## Calcium Phosphate Chemistry

Chemical Name	Formula	Abb. Name	Mineral Name	Structure	Solubility Product mol/litre
Amorphous calcium phosphate rock	$\text{Ca}_9(\text{PO}_4)_6$	ACP		Amorphous	
Monocalcium phosphate	$\text{Ca}(\text{H}_2\text{PO}_4)_2$	MCP			
Dicalcium phosphate dihydrate	$\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$	DCPD	Brushite	Amorphous	$2.32 \times 10^{-7}$
Dicalcium phosphate	$\text{CaHPO}_4$	DCP	Monetite	Amorphous	$1 \times 10^{-7}$
Tricalcium phosphate	$\text{Ca}_3(\text{PO}_4)_2$	TCP	Whitlockite	Amorphous	$2.07 \times 10^{-33}$
Tetracalcium phosphate	$\text{Ca}_4\text{O}(\text{PO}_4)_2$	TTCP	Hilgenstockite	Amorphous	
Pentacalcium hydroxylapatite	$\text{Ca}_5(\text{PO}_4)_3(\text{OH})$	HAP	Hydroxyapatite	Hexagonal	$2.34 \times 10^{-59}$
Pentacalcium fluoroapatite	$\text{Ca}_5(\text{PO}_4)_3(\text{F})$	FAP	Fluoroapatite	Hexagonal	$3.16 \times 10^{-60}$
Octacalcium phosphate	$\text{Ca}_8(\text{HPO}_4)_2(\text{PO}_4)_4$	OCP			$2 \times 10^{-49}$
Calcium pyrophosphate	$\text{Ca}_2\text{P}_2\text{O}_7$	CPP			

## Hydroxyapatite Solubility

Pilot Plant 2 Flow Variation with Antiscalant A, B & C

Pilot Plant 2 Pressure Variation with Antiscalant A, B & C

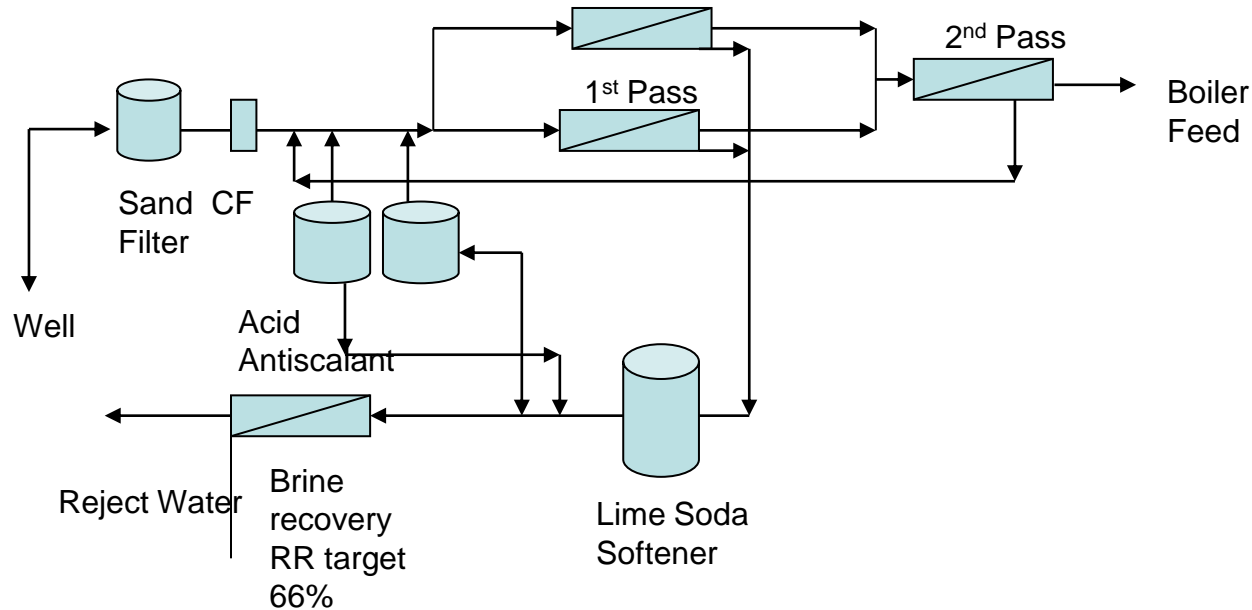

## Genesys PHO

- Initial trial work shows excellent results
- Confirmed under operational conditions
- Reduces or stops need for acid dosing
- Performance exceeds conventional anti-scalants
- 3-5 mg/l Genesys PHO increases saturation by 150 times
- Highly effective against all scaling species
- Enhanced threshold inhibition is key to effectiveness

## Efficient operation at high sulphate levels

### 2 pass BWRO - Hydranautics CPA3 & 4

- |                 |                                       |                            |
|-----------------|---------------------------------------|----------------------------|
| •1st pass       | 3,400m <sup>3</sup> /day 64% Recovery | <b>Actual 48%</b>          |
| •2nd pass       | 1,400m <sup>3</sup> /day 85% Recovery | <b>Actual 85%</b>          |
| •Brine recovery | 66% recovery                          | <b>Actual - inoperable</b> |

## Operational Issues

- High calcium and sulphate levels
- Acid dosing 132kg/day HCl
- 1<sup>st</sup>. Pass Recovery only 48%
- Feed Pressure 2 Bar above Target.
- High  $\Delta P$
- Membranes cleaned every 4 weeks
- Membranes replaced annually

## Genesis Solution

- Membrane Autopsy
- Detailed Site Survey & feed water analysis
- Feed Water software projection
- On site trial with Genesis CAS

## Genesys Recommendations

- Genesys CAS replaced conventional antiscalant
- Chlorine, acid and bisulphite dosage stopped
- Recovery increased 48 to 61%
- Membrane manufacturer software used to calculate water and energy savings

Hydranautics RO Projection Program - [Calculation of power requirement]

<b>Total Saving, US\$ pa</b>	<b>\$136,000</b>

## Efficient operation at high silica levels

- **Silicon Dioxide, SiO<sub>2</sub>.** Silicon and oxygen are the two most common elements in the Earth's crust.
- **Silica solubility:** increases with pH & temperature

# Silica Chemistry

1. Colloidal Silica – Non-reactive
  2. Dissolved Silica – Reactive
- Colloidal Silica doesn't permeate and so will foul membranes – Alumino-silicates clay
  - Silica deposition increases in presence of iron. Manganese and aluminium

Genesys Si – combines phosphonate and polymeric compounds

## Silica Case Study – Genesys SI

Case Study	BWRO Arica Chile
<b>Parameters</b>	<b>Improvements</b>
Feed Silica 60mg/l	Reject 256mg/l
pH 7.2 (reduced to 6.5 H <sub>2</sub> SO <sub>4</sub> )	Recovery rate Improved to 75%
4 skids – 2 stage 864 elements	3.8mg/l Genesys SI
Permeate 18,000 m <sup>3</sup> /day	Water saving 2,566,680 m <sup>3</sup> /year
Operating Recovery 60%	Energy Saving 3,836,160 kWhr/year
Silica fouling – 2 monthly cleaning	Energy Costs US\$268,531

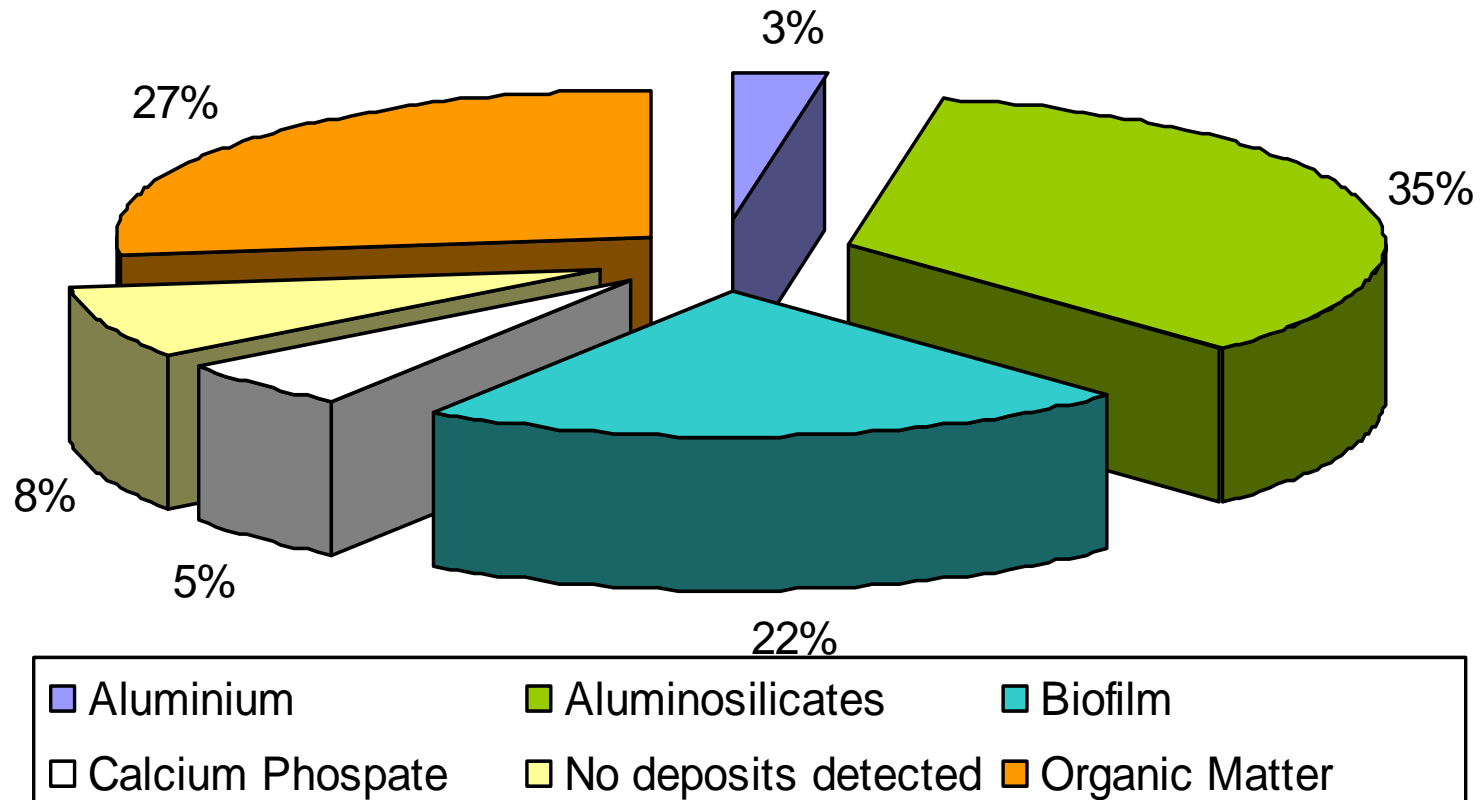

Organis

## Cleaning Clay from Fouled membranes

Lead Elements 2001-2009 Source: GMP Laboratory Madrid

- Most common foulant in lead membrane elements
- Clay is colloidal alumino-silicates
- Source is erosion products in surface waters
- Reduction in flux and increases  $\Delta P$

Sheet structure – Tetrahedron rings

Water in mineral crystal structure

Plasticity – irreversible deformation under pressure

Organisers

International  
Water Association

Powdered product - 100% active

- Phosphate cleaner, detergent,
- Surfactant
- Ionic strength builder to generate normal osmosis, helps “clear” the pores.

Normal Osmosis

Reverse Osmosis

## Clay Fouling Mechanism

• Particles  $< 2\mu\text{m}$  pass through pre-treatment system

## Clay Fouling Mechanism

•Clay particles begin to foul membrane surface forming cake layer

## Clay Fouling Mechanism

- Fouling begins to reduce flow
- Feed pressure increased to compensate

## Clay Fouling Mechanism

- Plasticity – increased feed pressure deforms & compresses particles
- Pores become blocked & foulant less permeable to water.

## Clay Fouling Mechanism

- Cake layer continues to compress & becomes impermeable to water
- Permeate flow reduced
- Normal Cleaning solution can't penetrate layer

19-24 September 2010

## Genesol 703 Cleaning low pressure

- 1-3% solution of Genesol 703
- CIP 35-40°C
- <4 bar

19-24 September 2010

## Add Cleaning Solution

19–24 September 2010

## Mode of Action – surface tension

- Water/surface inter-phase – surface tension reduced, surfactant penetrates deposit
- Deposit becomes more permeable allowing G703 to penetrate

## Mode of Action – deposit removal

- High Ionic Strength
- Osmotic pressure reverses flow
- Deposits “lifted” away from surface
- Minimises abrasion

## Low pressure flush

•Flushing removes particles

## Fouling prevention – pre-treatment optimisation

**Membrane Autopsies 2001-2006. Main cause of failures detected.**

- Deficient pretreatment
- Plant recovery & Anti-scalant dosage issues
- Dose of chemicals (floculant, coagulants...)
- Issues on cleaning procedures
- Oxidation processes

63% of RO membrane failures are caused by inefficient pre-treatment or coagulant/floculant fouling

## Chemical Pre-treatment Mechanisms

- **Flocculation** – bridging of particles by polymer chain forming flocs
- Particle agglomeration allows mechanical removal

Flocculant Bridging

## Cationic & Anionic Flocculants

- **Cationic Flocculants:**
  - Acrylamide copolymers with cationic monomer
  - Polyquaternary amines are pH insensitive
  - Chlorine resistant
  - Inorganic suspended solids removal
  - High molecular weight effective at removing large amounts of solids.
- **Anionic Flocculants:**
  - Acrylamide copolymers contain 2 types of monomer unit
  - pH sensitive functions best > pH 6
  - Target Organic removal

## Pre-treatment & membrane fouling

- **Established view that despite the advantages of cationic flocculants they are incompatible with RO & NF membranes:**
  - Soluble  $\text{Fe}^{3+}$  or  $\text{Al}^{3+}$  form hydroxides fouling membrane surface
  - Acrylate antiscalent reaction fouls membranes
  - Aluminium & iron based coagulants may attach direct to membrane surface
  - Oil or latex in some flocculants may adhere to membrane surface.

Iron Acrylate Fouling

Aluminium Fouling

## Polyacrylamide

19-24 September 2010

- Pendular branches
- Hook on to membrane
- Oil or latex suspensions

## Polyamine (Genefloc GPF) flocculant

- Charge on molecule backbone
- Loose attraction on membrane
- Subject to shear forces
- Cationic charge neutralised by anionic phosphonate antiscalant

## Genefloc GPF – Case Study

- 1,400 m<sup>3</sup>/day SWRO plant
- Feed tank 3 hour residence time.
- Genefloc GPF dosed at 2mg/l with 0.3mg/l sodium hypochlorite
- 3 dual media filters sand & anthracite
- 5 µm cartridge filters
- Sodium bisulphite dosage & Genesys LF antiscalant
- 2 trains of 56 DOW SWHR 380 RO membranes
- Plant operational with the same membranes since September 2003

## GPF feed water treatment – Leparc et al 2005

2005	SW Intake	Well SW	Raw Water	DMF effluent	CF Effluent
Turbidity (NTU)	1.6	0.3	0.4-1.1		
SDI 3 min	18.3	7.1	11.8		
SDI 5min	13.2	5.4	9.0		
SDI 15min	5.8	2.6	4.4	2.1	2.0

Organisers

## Genefloc GPF – Conclusions

- **Cationic charge** – located on backbone not pendular sub branches preventing irreversible membrane attachment
- **Molecular Size** – long chains prevent pore attachment allowing easy removal by shear forces
- **Solubility** – dilution & low dose rate allows easy absorption onto media filter surface

## Optimising pre-treatment – reducing membrane fouling

Particle counting instruments have become a valuable tool when DESIGNING, EVALUATING and OPTIMIZING FILTRATION SYSTEMS.

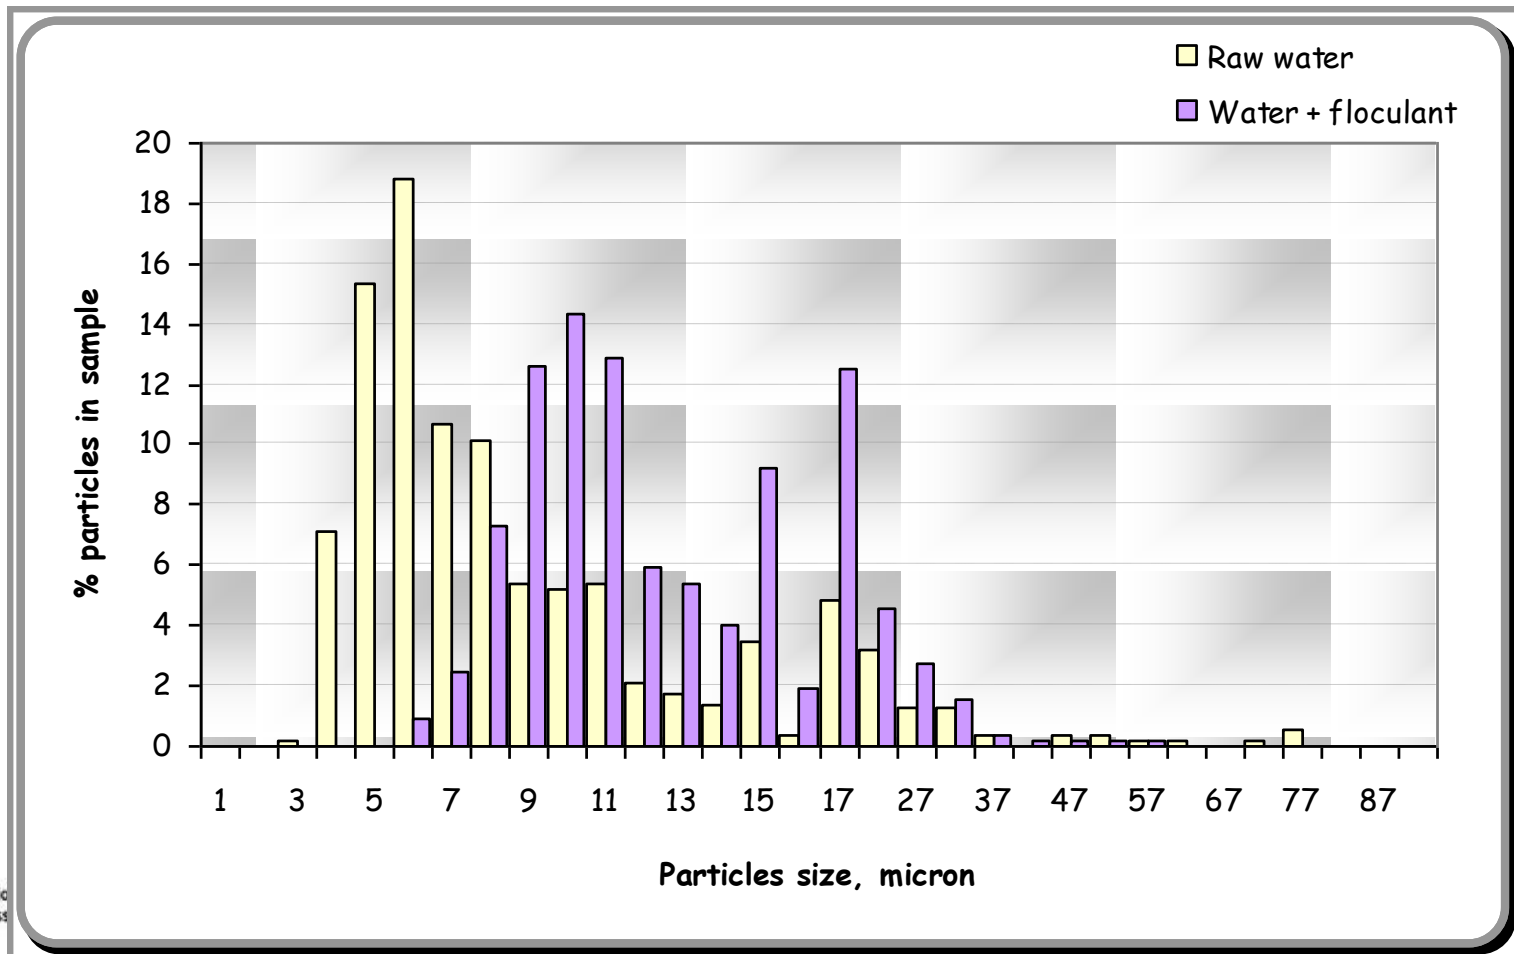

## Particle counter

## Optimizing coagulant and flocculant dosing using particle counter

## Cleaning Frequency & Efficiency

**DOW FILMTEC** “..... the correct pH is critical for optimum foulant removal. If a foulant is not successfully removed, the membrane system performance will decline faster ..... The time between cleanings will become shorter, resulting in shorter membrane element life and higher operating and maintenance costs”

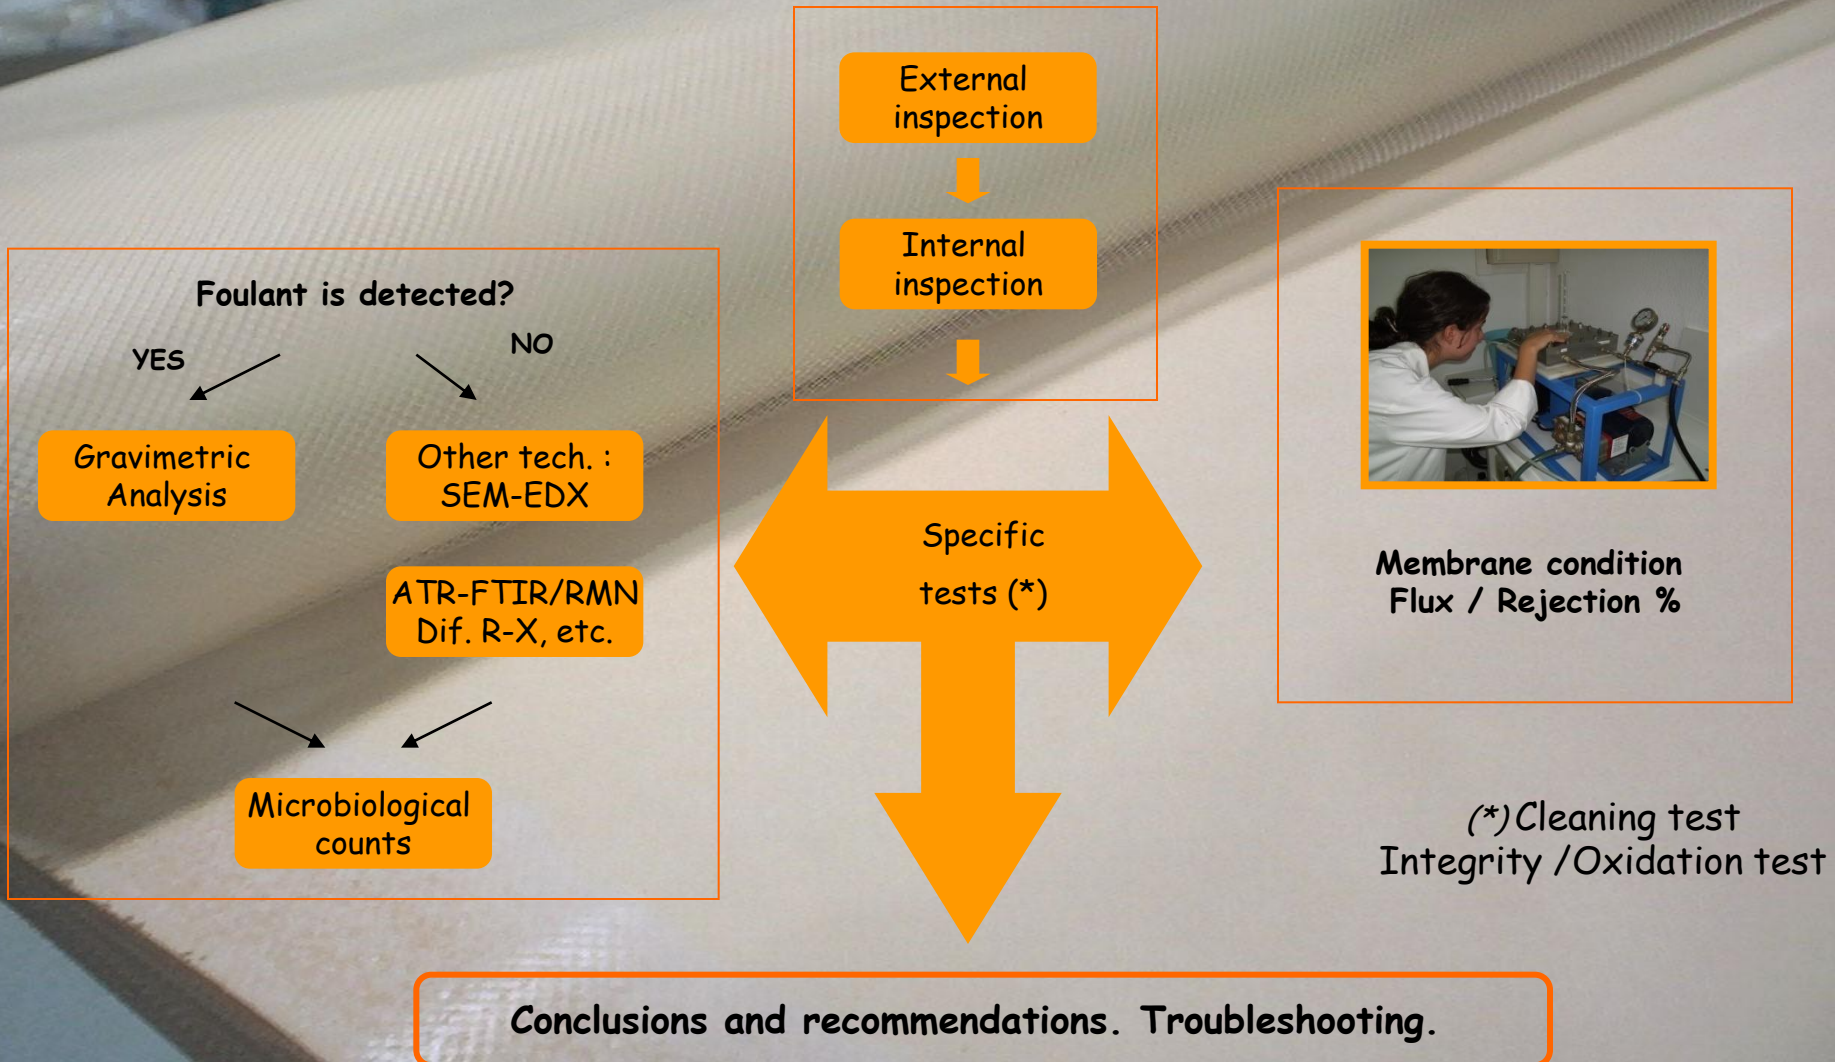

### **Hydranautics:**

“The appropriate solution to use can be determined by chemical analysis of the fouling material. A detailed examination of the results of the analysis will provide additional clues as to the best method of cleaning”

## Membrane Autopsy Methodology

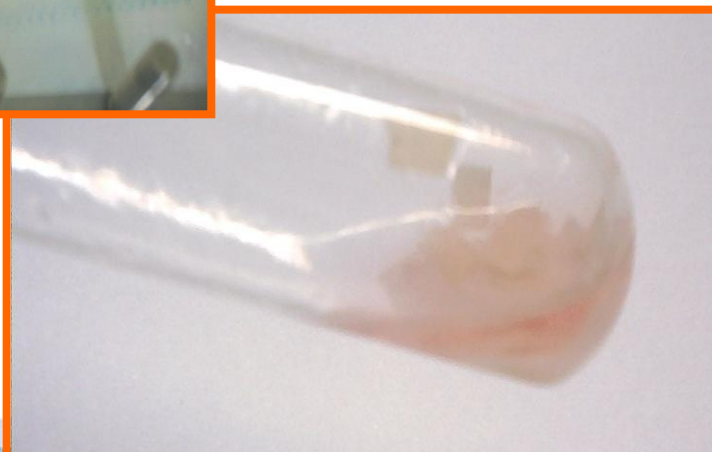

**Membrane condition  
Flux / Rejection %**

**(\*)** Cleaning test  
Integrity / Oxidation test

## Membrane Autopsy Chemical & Physical Damage

## Foulant Identification – GMP Madrid

### Foulant Identification:

- Scanning electron microscopy (SEM-EDAX)
- Infrared Spectroscopy (ATR-FTIR)
- X-Ray Diffraction analysis ATR
- Nuclear Magnetic Resonance (NMR)

### Membrane Autopsy

## Genesol Product Selection

- Genesol products tested against the foulant under different conditions
- Product selected based on recovery of membrane to design flux and salt rejection
- SEM-EDAX comparison of membrane surface before and after cleaning procedure

## Membrane Autopsy alternatives

### Cartridge Filter:

- SEM-EDAX identification of foulants on cartridge filter

### SDI Filter Paper:

SEM-EDAX of 0.45 µm SDI filter paper deposit identification

## Membrane Autopsy

- Monitoring of Membrane condition helps prevent problems.
- Process gives positive answers in event of failure.
- Ensures optimum cleaning programme application.
- Scientifically based answers in event of membrane issues.

# Conclusions

- RO engineers design innovations
- Chemists help make the plant work
- Lab techniques help improve operation
